

Governance Module – Observations & Recommendations

1. Document Hierarchy & Relationships

- The AI Draft Policy currently supports multiple document types (Policy, Standard, Procedure, Guideline, etc.). However, the relationship between these document types is unclear.
- There should be a structured mechanism to define relationships between documents (e.g., Policy → Procedure → Standard).
- The system should enable users to generate **Procedures or Standards directly from an existing Policy using AI assistance**, ensuring logical alignment and traceability.

2. Document Creation & Framework Mapping

- Under **Governance → Policies**, the module should ideally restrict creation to **Policy documents only**. Currently, it allows multiple document types (Standard, Procedure, Guideline, Charter, Framework), which creates confusion.
- When creating a new document (via file upload or “+ New Document”), there should be an option to:
 - Link the document to an **existing framework**, or
 - Create it as an **independent document**
- Clarification is needed on:
 - Whether a Policy must be mapped to a framework before creation
 - Whether independent policies are supported without framework linkage

3. Policy–Procedure Dependency Limitation

- The system currently does not allow creating a **Procedure based on an independently created Policy**.
- This is a key limitation. The system should support:
 - Creating downstream documents (Procedures, Guidelines) from any Policy, regardless of whether it is framework-linked or standalone.

4. AI Regeneration & Prompt Control

- The “**Regenerate**” option in AI-generated policies lacks user control.
- There should be an input prompt allowing users to:
 - Specify what changes are required
 - Refine sections instead of regenerating the entire document blindly
- This will significantly improve usability and reduce rework.

5. Gap Analysis Usability

- The **Gap Analysis** feature is not intuitive.
- It is unclear:
 - How to initiate gap analysis against a specific policy
 - What inputs are required
 - What outputs are generated
- The feature requires better guidance, workflow visibility, and possibly a step-by-step interface.

6. Committee Management Enhancements

- Under **Governance** → **Committee**, the system only supports AI-generated charters.
- Recommendations:
 - Allow users to **upload or manually create committee charters**
 - AI-based charter generation should be:
 - Triggered based on **user input**
 - Configurable per **specific framework or policy**, not automatically applied to all frameworks
- Current behavior (auto-generating charters for all frameworks) is not practical and needs correction.

Compliance Module – Observations & Recommendations

1. Framework Search Functionality

- The **Frameworks** screen **lacks a search feature**, making navigation difficult.
- A search and filter option is essential for usability, especially when multiple frameworks are present.

2. Framework Upload Issues

- Uploading certain frameworks (e.g., CMMI PDF) fails with an error: *“Failed to upload framework. Please try again.”*
- However, other files upload successfully.
- This indicates:
 - Potential file validation or parsing issues
 - Need for better error diagnostics and validation feedback

3. Framework Parsing Transparency

- For uploaded frameworks (e.g., ISO/IEC 27001:2022), the system generates:
 - Overview
 - Phases
 - Controls
 - Applicability
- While Overview and Phases appear AI-generated, the origin of Controls and Applicability is unclear.
- Recommendations:
 - Provide transparency on how each section is generated
 - Allow users to **edit, modify, or delete AI-generated content**, at least for Overview and Phases

4. Parsing Progress Visibility

- There is no indication of processing time when uploading frameworks.
- Users are left uncertain about completion status.
- A **progress bar, percentage indicator, or status notification** should be implemented.

5. Controls Accuracy & Editability

- Under **Compliance** → **Controls**, the system auto-generates controls from parsed frameworks.
- Observed issues:
 - Invalid or ambiguous controls (e.g., in NIST SP 800-218)

- Recommendations:
 - Implement validation mechanisms
 - Allow users to **edit, refine, or delete controls**

6. Statements Clarity & Management

- In the **Statements section**:
 - The “Statement Text” under the Action button is incomplete and ambiguous
 - It does not clearly align with supporting evidence
- Recommendations:
 - Ensure full visibility of statement text
 - Improve linkage between statements and evidence (360-degree traceability)
 - Enable **Add, Edit, Delete** functionality for statements

7. Assessments Module Usability

- The Assessments section is unclear and difficult to interpret.
- Example: Display shows “*1 assessment out of 108 items*”, but users cannot easily view all items.
- Recommendations:
 - Improve UI/UX to allow full visibility of all assessment items
 - Provide clear navigation and context for assessment progress

8. Evidence Upload Stability

- Under **Compliance** → **Evidences**, uploading image files causes the system to freeze.
- Users are forced to restart the browser.
- This is a critical stability issue and requires immediate fixing.
